

# GROWING GARLIC

1. Garlic should be planted from 11/15 to 12/15.
2. Separate each clove from bulb (don't peel off skin).
3. Plant garlic clove (root side down) about 2-3" deep and about 4-6" apart.
4. Mulch with 4 inches of straw.
5. In early spring fertilize your garlic with a high nitrogen fertilizer. Keep garlic watered throughout the spring.
6. In late spring/early summer you will notice a seed head forming from the top of the garlic plant. Remove the seed head ASAP to increase the garlic bulb size.
7. Stop watering your garlic approximately 2 weeks before harvesting. Garlic harvesting is usually during the 1<sup>st</sup> half of June.
