Growing Great Okra

KCCG
KANSAS CITY COMMUNITY GARDENS

KCCG's Varieties

Burgundy - 55 days - Bears moderate amounts of red pods on tall plants. Pods turn green when cooked.

Clemson Spineless - 55 days
The most popular okra variety available. Plants are 4-6' tall with straight, deep green, spineless pods.

Dwarf Green Longpod
50 days - Pods are bright green, ridged and tapered and tend to be more slender than the Clemson Spineless. Plant height is 3-4' tall.

Jambalaya - This early producing, high yielding okra has delicious tender pods on compact plants. (hybrid)

Planting:

Plant 5/1-5/25

(Guidelines for planting in raised beds)

Seeds: Sow seeds in rows spaced 12- 18" apart. Seeds should be spaced 10-12" apart and then thinned to stand 12" apart.

Care:

Seeds: Water the seeds regularly with a gentle spray. Keep the soil moist, so that the seeds will germinate.

Thin the plants so that they stand 12" apart from each other in each row.

Young seedlings: Water when top 1 inch of soil dries out. Mulch plants with cotton burr compost or straw to keep the soil moist and to stop weeds from growing.

Harvest & Storage:

Okra produces many yields throughout the growing season. Often times pods will need to be harvested every 3 to 4 days once the plant begins producing. Typically, pods should be harvested once they reach 1.5 to 3 inches. Okra pods become hard and stringy if they are allowed to grow to be more than 5 inches. Use scissors or shears to cut pods at their stems.

Nutritional Facts:

Okra contains a healthy amount of Vitamin C, calcium, iron and is rich in fiber.

Okra contains a large amount of folate, a vitamin that prevents birth defects.
